

**BMW Touring**

**The engine**

BMW engines all have an overhead camshaft, inclined valves in an inverted V-arrangement, and a crankshaft with five bearings. Swirl-action combustion chambers contribute to this high degree of perfection. And the result is that today's BMW engines already fulfil tomorrow's pollution laws.

The decisive characteristic of this design is not just supreme performance. But also flexible engines and spare power whenever you need it. So that you have full acceleration at any speed and overtaking becomes a matter of just a few seconds. How about this as an example: The BMW Touring 2000ti rockets up from 0 — 60 mph in 9.2 seconds. It's really not surprising to hear what motoring journalists think: BMW four-cylinder engines have all the power, smoothness, and superiority that you'll normally only find in a six cylinder.

**Functionability**

The foremost aspect of all BMW

designs is functionability. This starts with the engine, chassis, and braking system and goes on to the bodywork and the interior fittings. We think that luxury should also be functionable. The seats can be adjusted individually and hold the body snug-

ly. The backrests of the rear seats can be pulled forward separately and fastened in this horizontal position. So that you have even more space whenever you need it. The cushioned instrument panel features circular dials with an anti-dazzle effect.

The switch for high beam and low beam, the flasher, the direction indicators, and the automatic screen washer have been designed for fingertip operation, so that the driver is not distracted and can keep both hands on the wheel.

#### **The interior**

The BMW Touring features the largest interior of all comparable BMW models. It has a lot of room even for five persons. The backs of the rear seats can be folded down separately and fastened in this horizontal position,

so that the additional space this gives you can be used in many ways and for many purposes. By means of gas pressure springs the weight of the rear door is balanced exactly, so that the door can be moved with ease and always stays in the de-

sired position. All the versions of the BMW Touring are equipped with a demisting unit for the widescreen and the side windows as standard and an electrically-heated rear window is also included in the basic equipment.
